Spectrum Server Ethernet Module

South Bend, In, November 8th, 2010: Control Development, Inc. has introduced a spectrum server ethernet module, which allows remote operation of any USB2-type Control Development spectrometer. Further, it allows remote operation of a spectrometer from anywhere on the network. *This module uses an on-board ARM microcomputer running an RTOS to control the spectrometer, providing high speed sampling with real time performance.* The computer queues up the time-stamped data (up to 65,000 spectra) until it can be read by the client, so there are no gaps in sampling.
